CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the
                                                                                                                                                                                                                                                                                                                                    STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the BST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SEQUENCING READ COVERAGE: Sequencing is completed to a minimum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /rpt_family="LiMA2"

INFORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

This sequence is the entire insert of clone C01B9. The true left end of clone ZK131 is at 18285 in this sequence. The true right end of clone R06B9 is at 100 in this sequence. The start of this sequence (1, 100) overlaps with the end of sequence CEK06B9.

The end of this sequence (24951, .25233) overlaps with the start of sequence CEEXX31.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 INV 29-JAN-2003

Submitted (13-MAY-2003) Ruman Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 13, 2003 this sequence version replaced gi:25086297.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table. Submitted (09-NOV-2001) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA (Dases 1 to 227182)

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                   1 224728: contig of 224728 bp in length

224828: gap of unknown length

2258852: contig of 1024 bp in length

3255952: gap of unknown length

327182: contig of 1230 bp in length.

- useful for modulating Copper-containing ribonucleoproteins angiogenesis.

Claim 2; Page 12; 16pp; German.

Internation describes mover copper.concurrants are described and supported to copper ions, and RNA comprising the following consensus sequence or its complement GGAAAAUNNINUMANIAUGMI-GCUNNIUUNNINUMANAANNO-1UANAAACAUNO-5CUUNAGNO-13AGAA-AUNO-16UUAGCAG where N = G, A, U or C. The ribonucleoproteins are stated to have the following properties (1) cell-selective morphogenic action in vitro on isolated primary and/or cloned blood capillary endothelial cells in culture for the non-mitogenic induction of the change in cell phenotype from the This invention describes novel copper-containing ribonucleoproteins which

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                               insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated polynucleotide comprising any of 1477 sequences or its fragment, degenerate variant, antisense or complement. The polynucleotides and gene products are useful for treating or diagnosing tumour or cancer (e.g. products are useful for treating cancer or medullary carcinoma) in a subject (e.g. cattle, dogs, cats, rabbits, horse or human). The polynucleotides and polypeptides are also useful as vaccines for treating or preventing these diseases. The polynucleotides are useful for gene therapy. The present sequence is that of one of a group of polynucleotides (ABQBSHS-ABQBOOIS) disclosed electronically as sequences of the invention. However only 1271 polynucleotide sequences are given, whereas 1477 polynucleotides and 91 protetins are claimed. Note: The sequence data for this patent did not promise the content of the invention. However only 1271 protetins are claimed. Note: The sequence data for this patent did not become the content of the content of the content of this patent did not be content of the conte

capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insectiodides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABL302072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences

polynucleotides, and includes the derived probes, antisense oligonucleotides and antibodies thereof. The identification of these human prostate genes that can inhibit tumour growth is useful for understanding the progression and nature of complex diseases such as cancer, and hence they are important in the drug discovery process. The present invention describes these polynucleotides and encoded polypeptides as exhibiting cytostatic activity, and through gene therapy and/ or vaccines they can be used to modulate the immune response for the prevention or treatment of cancers, particularly of the prostate, but also for breast, lung and colon cancer. This polynucleotide sequence is a human cDNA sequence useful for the treatment of cancer, used in an exemplification of the invention. NOTE: These sequences are not given in the specification but are provided on the WIPO website.

New polynucleotides derived from human prostate, useful for modulating WPI; 2003-513972/48

immune response to prevent or treat cancer.

This invention relates to novel isolated polynucleotides of human origin, particularly isolated from the human prostate. Specifically, it refers to the diagnostics and therapeutics comprising these novel human polynucleotides, and includes the derived probes, antisense oulgonucleotides and antibodies thereof. The identification of these human prostate genes that can inhibit tumour growth is useful for understanding the progression and nature of complex diseases such as Claim 1; SEQ ID NO 493; 188pp; English.

New genes and gene products isolated from human prostate, useful for treating or diagnosing tumor or cancer (e.g. prostate cancer or breast cancer), or as vaccines for treating or preventing these diseases.

Claim 1; SEQ ID NO 419; 186pp + Sequence Listing; English

The invention relates to an isolated polynuclectide comprising any of 1477 sequences or its fragment, degenerate variant, antisense or complement. The polynucleotides and gene products are useful for treating or diagnosing tumour or cancer (e.g. prostate cancer, breast cancer, lung cancer or medullary carcinoma) in a subject (e.g. cattle, dogs, cats, rabbits, horse or human). The polynucleotides and polypeptides are also useful as vaccines for treating or preventing these diseases. The polynucleotides are useful for gene therapy. The present sequence is that of one of a group of polynucleotides (ABQB8745-ABQ90015) disclosed

the specification but are provided on the WIPO website.

```
This invention relates to novel isolated polynucleotides of human origin, particularly isolated from the human prostate. Specifically, it refers to the diagnostics and therapeutics comprising these novel human polynucleotides, and includes the derived probes, antisense oligonucleotides and antibodies the derived probes, antisense oligonucleotides and antibodies thereof. The identification of these human prostate genes that can inhibit tumour growth is useful for understanding the progression and nature of complex diseases such as cancer, and hence they are important in the drug discovery process. The present invention describes these polynucleotides and encoded polypeptides as exhibiting cytostatic activity, and through gene therapy and/or vaccines they can be used to modulate the immune response for the prevention or treatment of cancers, particularly of the prostate, but also for breast, lung and colon cancer. This polynucleotide sequence is a human cDNA sequence useful for the treatment of cancer, used in an exemplification of the invention. NOTE: These sequences are not given in
                                                                                                                                                                                                                                                                                                                                                                                                    0;

electronically as sequences of the invention. However only 1271 polynucleotide sequences are given, whereas 1477 polynucleotides and 91 proteins are claimed. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotides derived from human prostate, useful for modulating immune response to prevent or treat cancer.
                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human cDNA sequence useful for the treatment of cancer (SeqID 418).
                                                                                                                                                                                                                                                                                                                                                                                                 ;

The polynuclectides and gene products are useful for treating or diagnosing tumour or cancer (e.g. prosteta cancer, breast cancer, lung cancer or medullary carcinoma) in a subject (e.g. cattle, dogs, cats, rabbits, horse or human). The polynuclectides and polypeptides are also useful as vaccines for treating or preventing these diseases. The polynuclectides are useful for gene therapy. The present sequence is that of one of a group of polynuclectides (ABQ88745-ABQ90015) disclosed electronically as sequences of the invention. However only 1271 polynuclectides are given, whereas 1477 polynuclectides and 91
                                                                                                                                                                                      Human; prostate; cytostatic; tumour; cancer; vaccine; gene therapy; gene;

This invention relates to novel isolated polymuclectides of human origin, particularly isolated from the human prostate. Specifically, it refers to the diagnostics and therapeutics comprising these novel human polymucleotides, and includes the derived probes, antiesnse oligonucleotides and antibodies thereof. The identification of these human prostate genes that can inhibit tumour growth is useful for understanding the progression and nature of complex diseases such as cancer, and hence they are important in the drug discovery process. The present invention describes these polymucleotides and encoded polypeptides as exhibiting cytostatic activity, and through gene therapy and or vaccines they can be used to modulate the immune response for the prevention or treatment of cancers, particularly of the prostate, but also for breast, lung and colon cancer. This polynucleotide sequence is a human cDNA sequence useful for the treatment of cancer, used in an exemplification of the invention. NOTE: These sequences are not given in Ö, New polynucleotides derived from human prostate, useful for modulating Kita Human cDNA sequence useful for the treatment of cancer (SeqID 415). ```
The invention relates to an isolated polynucleotide comprising any of 1477 sequences or its fragment, degenerate variant, antisense or complement. The polynucleotides and gene products are useful for treating or diagnosing tumour or cancer (e.g. prostate cancer, breast cancer, lung cancer or medullary carcinoma) in a subject (e.g. cattle, dogs, cats, rabbits, horse or human). The polynucleotides and polypeptides are also useful as vaccines for treating or preventing these diseases. The polynucleotides are useful for gene therapy. The present sequence is that of one of a group of polynucleotides (ABO88745-ABQ80015) disclosed electronically as sequences of the invention. However only 1271 polynucleotides and 91 proteins are claimed. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pot_sequence
                                                                                                                                                                                                                                                                Human; prostate; cytostatic; tumour; cancer; vaccine; gene therapy; gene;

New polynucleotides derived from human prostate, useful for modulating immune response to prevent or treat cancer.

Claim 1; SEQ ID NO 1307; 188pp; English.

origin, efers to prevention or treatment of cancers, particularly of the prostate, but also for breast, lung and colon cancer. This polynucleotide sequence is a human cDNA sequence useful for the treatment of cancer, used in an exemplification of the invention. NOTE: These sequences are not given in This invention relates to novel isolated polynucleotides of human origin, particularly isolated from the human prostate. Specifically, it refers to the diagnostics and therapeutics comprising these novel human polynucleotides, and includes the derived probes, antisense oligonucleotides and antibodies thereof. The identification of these human prostate genes that can inhibit tumour growth is useful for understanding the progression and nature of complex diseases such as cancer, and hence they are important in the drug discovery process. The present invention describes these polynucleotides and encoded polypeptides as exhibiting cytoftatic activity, and through gene therapy and/or vaccines they can be used to modulate the immune response for the specification but are provided on the WIPO website.

Example 2; Fig 1; 245pp; English.

The invention relates to a novel isolated peptide comprising or consisting of an amino acid sequence selected from an amino acid sequence consisting of an amino acid sequence selected from an amino acid sequence of a variant oestrogen receptor protein (e.g. BRbeta), or a fragment of 10 amino acids), antibodies against them, nucleic acids encoding them concluding vectors for transforming cells). The gene for human Exbeta is located on chromosome 6q.25.1. The variant peptides and proteins can be used in assays to determine the biological activity of the protein, to take antibodies, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, to identify compounds that modulate receptor activity and to screen compounds for the ability to stimulate or inhibit interaction between the receptor protein and a target molecule that normally interacts with the receptor protein c.g. oestrogen. The antibody can be used to isolate the protein, to assess expression in disease states e.g. cardiovascular circuit. pharmacogenomic analysis and inhibiting protein function, e.g. blocking the binding of the oestrogen receptor protein to a binding partner such as a ligand. The nucleic acids encoding the proteins can be used as probes, primers, chemical intermediates and in biological assays. The present sequence is the human ERbeta gene autoimmune disease (e.g. systemic lupus erythematosus, arthritis, rheumatism and osteoarthritis), osteoporosis, breast cancer and endometrial cancer. In addition the antibodies can be used in

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AlDS, epilepsy, neurofibromatcsis, rheumatcoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antinfeumatic; antiarthritic; antidiabetic; antipsoriatic; antinflammatory; cancer; eye disease; arteriosclerosis; anaemia; acute myeloid leukaemia; Alzheimer's disease; AIDS; epilepsy; neurofibromatosis; rheumatoid arthritis; psoriasis; bowel disease; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine methylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     system disease; cytosine methylation; antiasthmatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          25.0%; Score 26.8; DB 6; Length 6419; 24.0%; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                         flowering buds. DNA was purified from a crude nuclear prep using Brasslca oleracea TO1000DH3 buds provided by Thosmas Osborn at the University of Wisconsin. Genomic DNA was provided by Pablo Rabinowicz (CSHL) and the shotgun library prepared at Washington University Genome Sequencing Center."

Zorn.

CDNA was oligo dT primed from 5ug of poly A+ RNA from neurula. BCORI-NoII cut CDNA was then ligated into pCS107 with EcoRI at 5' end and NoII at the 3' end.
